### Oil Injected Rotary Screw Compressors

The oil-injected screw compressor: Ambient air is taken in by the screw compressors and is compressed in the screw element. In this screw element, oil is injected during the compression. Before the compressed air leaves the compressor, the oil is separated from the air/oil mixture (we want compressed air – the oil must stay inside the compressor). The air leaves the compressor as compressed air and the oil is filtered, cooled and returned back to the screw element.

### How Oil-injected Rotary Screw Compressors Work - Air ...

The screw compressor element: When the inlet/unloader valve is open, the air enters the compressor screw element. The screw element works like a pump and it compressed the air. During this process, oil is injected in the element. The oil is there to cool the air, as the air gets very hot during compression.
